PROFILE

First-year master's student in Computer Science at UiS, with a BSc from UiS completed in June 2026. I build backend solutions in C#, ASP.NET Core and SQL. Alongside my studies I work as a teaching assistant in introductory programming (DAT120/DAT125) and as IT support and exam invigilator for digital exams. My bachelor's thesis, a simulation-based test framework for embedded systems written with ABB, was awarded grade A.

TECHNICAL SKILLS

Languages and frameworks	C#, ASP.NET Core, .NET, Entity Framework Core, Python, TypeScript, JavaScript, SQL
Databases	SQL Server, PostgreSQL, SQLite, data modelling
Backend	REST API design, JWT authentication, WebSockets, MQTT, unit testing, error handling
Tools	Git, GitHub, Docker, Kubernetes, CI/CD, Linux, Postman
Subject areas	Software development, object-oriented programming (OOP), algorithms and data structures, design patterns, system design, cloud computing, network security

EXPERIENCE

Teaching assistant, DAT120/DAT125 Introduction to Programming
University of Stavanger, Dept. of Electrical Engineering and Computer Science | Aug 2026 – present

- Guide students through programming in exercise sessions, focusing on debugging and code comprehension
- Review and approve mandatory assignments, explaining functions and data structures

IT support and exam invigilator (technical assistant, digital exams)
University of Stavanger, Examinations Office | Nov 2026 – Mar 2027

- Provide technical support to candidates during digital exams and supervise the exam venue

Cashier
Meny Kuben, Hønefoss | Nov 2022 – present

- Daily customer contact and responsibility for transactions, and problem solving under pressure

PROJECTS

Bachelor's thesis: simulation framework for ABB (grade A)
UiS in collaboration with ABB | Jan 2026 – May 2026

- Designed and implemented a distributed test framework for embedded systems using MQTT and shared memory (IPC)
- Built a proxy layer extracting signals from an ABB IPS controller into a Python-based RLC simulator, measured a mean round-trip latency of 7 ms and demonstrated virtual I/O testing without hardware

TA Queue – real-time queue for lab sessions
Personal project, used in UiS lab sessions | github.com/baselabu/uis-ta-queue | Sep 2026

- Built a live queue system in TypeScript (React, Express, Socket.io): students join by QR code, teaching assistants share one board, and the server resolves conflicts when two assistants pick the same student
- Deployed on Render as a single Node process with health checks

90-day backend program: TaskApi and Inventory Manager
Self-study | github.com/baselabu/Summer2026 | May 2026 – Aug 2026

- 6–8 hours a day in C# and ASP.NET Core: APIs from scratch, unit testing, Docker, CI/CD, LeetCode and system design
- TaskApi: REST API in .NET 10 with JWT login, full CRUD with EF Core and migrations, DTOs, central error handling
- Inventory Manager: layered C# system with repository and service interfaces, recursive search, swappable sorting strategies, transaction history and JSON persistence

Equinor energy optimisation
Atea Hackathon | Prototype for real-time electricity price optimisation, built in a team and presented to a jury | 2024

EDUCATION

MSc in Computer Science (Datateknologi)
University of Stavanger | Aug 2026 – Jun 2028 (expected)

- Courses: ethical hacking, network security, cloud computing, wireless communication, algorithm theory, distributed systems, generative AI, data engineering, blockchain technology; master's thesis 2027–2028

BSc in Computer Science (Bachelor of Engineering)
University of Stavanger | Aug 2023 – Jun 2026

- Thesis grade A, web programming A; software development, databases, algorithms and data structures, networks
